Assignment: Mini Project — Portfolio Page for Editkaro.in (VaultofCodes)

Tech Stack: HTML5, CSS3, JavaScript (no frameworks)

1. Project Overview

A portfolio website designed for Editkaro.in, a video editing and social media marketing agency, as part of the VaultofCodes internship assignment. The website showcases the agency's work across multiple video categories with dynamic filtering, embedded video previews, and modern UI animations.

The goal of the assignment was to build a visually engaging, fully responsive portfolio webpage using only HTML, CSS, and JavaScript — without relying on any front-end framework such as React.

2. Objective

- Design a visually engaging portfolio webpage for a real-world style client.
- Use HTML, CSS, and JavaScript to implement interactivity and responsiveness.
- Organize videos by category with clear navigation and filtering.
- Include creative elements such as video previews, filters, and animations.
- Ensure the webpage is fully responsive across devices.

3. Features Implemented

Feature	Description
Category Filtering	Vanilla JS DOM filtering of portfolio cards by data-category attribute
Video Popup / Lightbox	Clicking a card opens an embedded YouTube video in a modal overlay
Play Icon on Hover	SVG play button overlay fades in on thumbnail hover
Card Hover Animation	Cards lift (translateY), glow with a soft shadow, and thumbnail zooms in
Scroll Fade-Up Animation	Sections fade and slide into view using the Intersection Observer API
Smooth Scroll Navigation	Navbar links scroll smoothly to their target section
Page Loader	Brief branded loading animation shown on initial page load
Responsive Design	Dedicated layouts for desktop, tablet ($\leq 768\text{px}$), and mobile ($\leq 480\text{px}$, $\leq 360\text{px}$)

4. Portfolio Categories

The portfolio grid organizes sample work into the following categories, each filterable via the category buttons:

Category	Description
Short Form	Instagram Reels / YouTube Shorts style edits
Long Form	YouTube long-form / vlog style content
Gaming	Gaming highlight reels
Football	Match recaps and sports edits
eCommerce	Product launch and brand ad content
Documentary	Cinematic, documentary-style edits
Anime	AMV (Anime Music Video) compilations
Ads	Brand commercial edits

5. Technical Implementation Notes

5.1 HTML Structure

Semantic HTML5 sections are used throughout: <nav>, hero <section>, a filterable portfolio grid, an about section, a contact section, and a footer. Each portfolio card carries data-category and data-video attributes that drive the JavaScript filtering and modal logic.

5.2 CSS

Styling uses CSS custom properties for theming (a dark background with a red #FF3B5C accent), CSS Grid for the responsive portfolio layout (auto-fit / minmax), Flexbox for the navbar and filter row, and keyframe/transition-based animations for hover states and the page loader. Media queries at 768px, 480px, and 360px handle tablet and mobile breakpoints.

5.3 JavaScript

- Category filtering: toggles a hide/show class on cards based on the clicked filter button's data-filter value.
- Video modal: reads the data-video (YouTube video ID) attribute from the clicked card and injects it into an iframe inside a modal overlay.
- Scroll animation: uses the Intersection Observer API to add a 'visible' class to sections as they enter the viewport, triggering a CSS fade-up transition.
- Smooth scroll: intercepts navbar link clicks and scrolls to the target section using `scrollIntoView({ behavior: 'smooth' })`.
- Page loader: hides a full-screen branded loader shortly after the window's load event fires.

6. Project Structure

```
editkaro-portfolio/  
├── index.html  
├── style.css  
├── script.js  
├── README.md  
├──

    ├── screenshots/  
    └── images/
```

7. Deployment

The project is deployed as a static site on Vercel.

Live URL: <https://editkaro-portfolio-silk.vercel.app/>

8. Testing Checklist

- All filter buttons correctly show/hide the matching category of cards.
- Clicking a card opens the correct video in the modal; closing works via the close button, background click, and Escape key.
- Navbar links smooth-scroll to the correct section.
- Layout verified in Chrome DevTools device mode at desktop, tablet (iPad), and mobile (iPhone SE) widths.
- No errors present in the browser console.

9. Screenshots

The following screenshots are included to demonstrate the project's features and responsiveness.

10. Conclusion

This project demonstrates practical use of core front-end web development concepts — semantic HTML, responsive CSS layout techniques, and DOM-driven interactivity in JavaScript — to build a polished, animated, fully responsive portfolio website without relying on any external framework.

The project demonstrates practical front-end development skills and can serve as a strong portfolio project for internships and entry-level web development roles.
